An Industry First...AdminServer introduces both J2EE and .NET versions of their AdminLife&Annuity policy administration system

AdminLife&Annuity is the industry's first system available for both J2EE and .NET platforms, offering insurers the ability to choose the technology that best suits their environment

Las Vegas, NV, May 24, 2004— Today, at the ACORD/LOMA Insurance Systems Forum Conference in Las Vegas, AdminServer, Inc. announced the availability of the J2EE and .NET versions of its AdminLife&Annuity System (AL&A) – the industry's first solution available for both J2EE and .NET. With AdminServer offering the solution on both platforms, insurers are afforded the option to select the Web Services technology that is the best fit for their environment.

For those existing clients utilizing the original “.NET Framework” COM/DCOM version, they are able to easily upgrade to either of the new environments (J2EE or .NET) due to the autonomy of the AdminLife&Annuity rules-engine from the underlying technology. With the rules-engine design of the system, an insurer can start implementation in any of the three available technology environments and easily migrate to a new platform as their business and technology needs evolve.

With the addition of the .NET and J2EE based systems, AdminLife&Annuity is now able to leverage a plethora of technologies, including, JBoss, WebLogic, WebSphere, Linux. This breadth of technology support demonstrates AdminServer's unwavering commitment to offer solutions that fit well into an insurer's technology infrastructure, regardless of whether they have adopted .NET or J2EE based technologies. **Furthermore, with AdminServer's support of the ACORD standards, both versions of the AL&A solution utilize the ACORD compliant XML rules engine.**

Christopher Doggett, AdminServer's CEO, commented “We are extremely pleased to introduce the J2EE and .NET offerings and deliver on our promise of dual platform support. The extensive flexibility needed to achieve this was built into our original design of AL&A as a rules-driven system. With these latest AL&A versions, we have proven that our original design successfully and seamlessly translates to both platforms. Carriers no longer have to bet their future by being forced into a single technology decision. They now have the option to choose what will work best today and easily switch technology platforms should their future needs change.”

AdminServer CIO, Christopher Prabhu, added “AdminLife&Annuity has already proven itself to be a great solution for those insurers looking to replace legacy systems and/or consolidate multiple systems throughout the enterprise. The existing COM/DCOM based solution, currently in production at five client sites, has been very well received. Now, with the dual platform release of AL&A we can offer even more capabilities to the broader market, regardless of the insurer’s technology preference.”

About AdminServer, Inc.

AdminServer, Inc. is a premier solutions provider for the insurance community. AdminServer has been delivering administrative system solutions, web services, and consulting since 1998. Today AdminServer specializes in fixed and variable annuities, pensions, immediate annuities, and life insurance. Currently AdminServer offers the only life insurance and administration system designed specifically as a web application employing Microsoft’s .NET and IBM’s J2EE strategies and technologies.
